## Hamiltonian Dynamics <br> Problem Set \#1

1. Write down the Lagrangian for a double pendulum restricted to move under gravity in a vertical plane. A mass $m_{l}$ is connected by a light rod of length $l_{l}$ to a fixed support and a mass $m_{2}$ is connected to $m_{1}$ with a rod of length $l_{2}$. Use as generalized coordinates the angle $\theta_{1}$ and $\theta_{2}$ of the rods with the vertical. Find the generalized momenta associated with these coordinates.
2. A bead of mass $m$ can slide without friction along a horizontal circular hoop of radius $r$

$$
\left(x-x_{0}\right)^{2}+y^{2}=r^{2}
$$

The $x$ component of the center of the hoop undergoes forced harmonic motion

$$
\mathrm{x}_{0}=\mathrm{a}^{*} \sin (\mathrm{w} * \mathrm{t})
$$

Write down the equation of motion for the bead using the angle $\theta$ as generalized coordinate.

$$
\mathrm{x}-\mathrm{x}_{0}=\mathrm{r}^{*} \cos \theta ; \mathrm{y}=\mathrm{r}^{*} \sin \theta
$$

3. The principle of least action can be extended to "Lagrangians" that contain higher time derivatives than first of the generalized coordinate $q_{i}$. Show that, if

$$
\mathrm{S}=\operatorname{Int}_{\mathrm{a}}{ }^{\mathrm{b}}\left[\mathrm{dt} \mathrm{~L}\left(\mathrm{q}_{\mathrm{i}}, \mathrm{q}_{\mathrm{i}}^{\prime}, \mathrm{q}_{\mathrm{i}}{ }^{\prime \prime}\right)\right]=\text { extremum }
$$

subject to fixed values of $q_{i}$ at the ends, the corresponding Euler-Lagrange equation becomes

$$
\mathrm{d}^{2} / \mathrm{dt}^{2}\left(\partial \mathrm{~L} / \partial \mathrm{q}_{\mathrm{i}}{ }^{\prime}{ }^{\prime}\right)-\mathrm{d} / \mathrm{dt}\left(\partial \mathrm{~L} / \partial \mathrm{q}_{\mathrm{i}}{ }^{\prime}\right)+\partial \mathrm{L} / \partial \mathrm{q}_{\mathrm{i}}=0
$$

Apply this to the equation of motion for

$$
\mathrm{L}=-\mathrm{mqq}{ }^{\prime \prime} / 2-\mathrm{q}^{2}
$$

4. A particle moves in the ( $\mathrm{x}, \mathrm{y}$ )-plane with speed proportional to the square of its distance from the origin. What is the minimum-time path between the points $(1,1)$ and $(0,2)$.

Hint 1: It might help to solve this problem using polar coordinates.
Hint 2: The construction of this problem is similar to that of the Brachristochrone.
