## Science One Physics Midterm \#1

October 16, 2012
Questions 1-8: Multiple Choice: 2 points each
Questions 9-10:3 points each
Questions 11-12: Explain your work: 20 points total
Multiple choice answers:

| $\# 1$ |  |
| :--- | :--- |
| $\# 2$ |  |
| $\# 3$ |  |
| $\# 4$ |  |
| $\# 5$ |  |
| $\# 6$ |  |
| $\# 7$ |  |
| $\# 8$ |  |

Question 1: The figure shows the location of a ball at equal time steps. If the x axis points to the right, we can say that the ball's
A) $X$ velocity is positive and $X$ acceleration is positive
B) X velocity is positive and X acceleration is negative
C) $X$ velocity is negative and $X$ acceleration is positive
D) $X$ velocity is negative and $X$ acceleration is negative
E) $X$ velocity is negative and $X$ acceleration is zero

Question 2: A man jumps off a bridge with an elastic cable connecting him to the bridge. The cable causes him to bounce back up before he hits the ground. When the man reaches his lowest point, we can say that
A) All the forces on the man cancel out
B) There is a net force upwards
C) There is a net force downward

Question 3: For the object described by the position vs time data below, the instantaneous velocity at time 0.03 s is closest to
A) $158 \mathrm{~m} / \mathrm{s}$
B) $18 \mathrm{~m} / \mathrm{s}$
C) $15 \mathrm{~m} / \mathrm{s}$
D) $5 \mathrm{~m} / \mathrm{s}$
E) $1 \mathrm{~m} / \mathrm{s}$

| Time $(\mathrm{s})$ | Position $(\mathrm{m})$ |
| :---: | :---: |
| 0.00 | 4.20 |
| 0.01 | 4.40 |
| 0.02 | 4.58 |
| 0.03 | 4.74 |
| 0.04 | 4.88 |

(assume the position is smoothly increasing during the times shown)

Question 4: A ball rolls up a ramp as shown. Which of the following graphs could represent the ball's horizontal velocity as a function of time?

Question 5: A rock is thrown straight up into the air. Taking into account air drag, we can say that the downward acceleration after the throw but before the rock reaches its maximum height is
A) Greater than $g$
B) Equal to $g$
C) Less than $g$ but greater than zero
D) Equal to zero

Question 6: In the top picture above, the arrows show the velocities of two balls (of mass M and 2M) that collide and stick together. Which of the other four pictures best represents the velocity after the collision?

Question 7: The graph above shows the acceleration vs time for an object that starts at rest at $t=0$. At which time is the speed of the object is greatest?
A) A
B) B
C) C
D) D
E) Cannot be determined

Question 8: The figure shows the radial probability distribution for electrons in different orbitals of a hydrogen atom. Suppose we measure the potential energy of the electron in various hydrogen atoms for which an electron occupies the 1 s or 2 p orbital before the measurement. We will find that:

A) Each of the 1 s electrons has smaller potential energy than each of the $2 p$ electrons.
B) Each of the 1 s electrons has larger potential energy than each of the $2 p$ electrons.
C) Some 1 s electrons may have smaller potential energy than some $2 p$ electrons but the average potential energy for the 1 s electrons is larger than the average potential energy for the $2 s$ electrons.
D) Some 1 s electrons may have larger potential energy than some $2 p$ electrons but the average potential energy for the 1 s electrons is smaller than the average potential energy for the $2 s$ electrons.

Question 9: An object of mass $M$ is acted on by a net force $F$ for which depends on the objects position X by:

$$
F / M=-\left(10 \mathrm{~m} / \mathrm{s}^{2}\right) X
$$

In the table below, fill in the acceleration at time 0 and the position and velocity at time $t=0.01 \mathrm{~s}$ (estimated).

| Time $(\mathrm{s})$ | position $(\mathrm{m})$ | velocity $(\mathrm{m} / \mathrm{s})$ | acceleration $\left(\mathrm{m} / \mathrm{s}^{2}\right)$ |
| :---: | :---: | :---: | :---: |
| 0 | 1.20 | 8.00 |  |
| 0.01 |  |  |  |

Question 10: The middle graph below shows velocity vs time for a moving object. Fill in the top and bottom graphs of position and acceleration vs time, assuming the position of the object is 0 at $\mathrm{t}=0$.

Question 11: On the final flight of the space shuttle Atlantis, astronauts brought along a sea cucumber as part of an astro-marine-biology experiment. When the sea cucumber was removed from its tank and allowed to float freely, it became nervous because of the zero-gravity environment and expelled its viscera (various internal organs).

If the sea cucumber (with initial mass 0.3 kg ) was initially stationary relative to the shuttle and if the viscera (mass 0.1 kg ) are observed to travel at $1 \mathrm{~m} / \mathrm{s}$ relative to the shuttle after being ejected, how long does it take until the sea cucumber and its insides are 2 m apart? You may assume the viscera are expelled all at once.
(8 points)

BONUS PART (for zero marks): Suppose the sea cucumber wants to go for a space walk. On which end should we put the water-filled space helmet so that the sea cucumber can breath? Draw the space helmet on the sea cucumber above.

Question 12: Barbie finds out that her owner is planning to launch her into the sky on a rocket with no parachute. So, she quickly changes into her Barbie Jet Boots (and a matching outfit). When she is falling, Barbie (mass 0.2 kg ) reaches a terminal velocity of $50 \mathrm{~m} / \mathrm{s}$. If her jet boots produce a thrust force of $(1.6 \mathrm{~N} / \mathrm{s}) t$, how high above the ground should Barbie turn on her jet boots if she wants her speed to decrease to zero just as she reaches the ground? Use $g=10 \mathrm{~m} / \mathrm{s}^{2}$ and assume we can ignore air drag after the boots are turned on.

Question 13: (kind of a bonus question... 3 measly points...attempt this only if you are done everything else...you're working for glory more than anything here).

Suppose the sea cucumber in question 12 actually ejects its viscera over a period of time and that the speed of the ejected material is always $1 \mathrm{~m} / \mathrm{s}$ relative to the sea cucumber. Determine the final speed of the sea cucumber relative to the shuttle.

## FORMULA SHEET

$$
\overrightarrow{\mathrm{p}} \approx \mathrm{~m} \overrightarrow{\mathrm{v}} \quad(\text { if }|\vec{v}|<c \mathrm{c}) \quad \overrightarrow{\mathrm{v}}=\mathrm{d} \overrightarrow{\mathrm{x}} / \mathrm{dt} \quad \overrightarrow{\mathrm{a}}=\mathrm{d} \overrightarrow{\mathrm{v}} / \mathrm{dt} \quad \overrightarrow{\mathrm{~J}}=\Delta \overrightarrow{\mathrm{p}}
$$

$$
\overrightarrow{\mathrm{F}}=\mathrm{d} \overrightarrow{\mathrm{p}} / \mathrm{dt}
$$

$$
|\mathrm{F}|=\mathrm{Cv}^{2}, \quad|\mathrm{~F}|=\mu \mathrm{N}, \quad|\mathrm{~F}|=\mathrm{mg}, \quad|\mathrm{~F}|=\mathrm{kx}
$$

$$
E=m g h \quad E=1 / 2 m v^{2} \quad E=1 / 2 k(\Delta s)^{2} \quad E=m c^{2}
$$
